20	PD	3,000	14.7 PSI	Cement	10960

Rails as We See Them Today

In the 18th Century an event began that would change the world. It swept across Great Britain, Western Europe and into America. Eventually it's effects would reach into the far corners of civilized earth. This great tide would come to be known as The Industrial Revolution. No one really knows what caused this incredible change. It is likely the advances in the sciences of mathematics and physics of the previous century played a large part. Colonial expansion into the Americas and the huge wealth that came with it probably did not hurt either.

Steam was the force that powered the revolution. Although steam is not fussy about the source of fuel used to produce it, one source was in plentiful supply, and that was coal. For centuries already, coal had been moved on wagonways. By the use of wooden rails and flanged wheels one horse could move literally tons more coal on each and every load. In the beginning of the industrial revolution the wooden rails were no more than a few inches wide and fastened end to end to logs or "sleepers" placed crosswise every two or three feet. To improve wear on the rails they were later covered with an iron sheath or plating. Of course this caused excess wear on the wheels and by the mid 18th century, iron wheels were introduced. This in turn caused some iron sheathes to buckle. What other outcome could there be? Rails made completely of iron.
