### WILL ETHANOL MOVE US?

Ethanol has been touted as the answer to the oil problem. President Bush is on the band wagon. He would like us to reduce gasoline consumption by 20% over 10 years by using alternative fuels, mostly ethanol. Ethanol production is ramping up in a big way. There are over a 100 ethanol plants operating now in the U.S. and that number will be closer to 200 soon. The United States will have the potential to produce 11 - 12 billion gallons a year by 2008. Unfortunately the U.S. uses about 146 billion gallons of gasoline a year now, and that number is only going to get bigger.

Some estimates show the maximum amount of ethanol production via corn to be around 30 billion gallons. At that rate, if you don't mind giving up corn for dinner, we can, at best, only approach the President's 20% desired reduction. Since the U.S. imports about half it's oil, our dependency on foreign oil is unlikely to change given our increasing consumption. Alternative cellulosic methods of ethanol production, such as wood chip or grasses, currently may be twice as costly as corn. Technological advances in these sources should make corn a stop gap measure to future ethanol production.

There are other concerns with ethanol as well. There is debate on whether a gallon of ethanol produces enough energy to recover the fossil fuel energy used in it's production. Thus, it may only increase U.S. energy demands. Ethanol also has transport problems. Unlike gasoline, ethanol absorbs water and can only be transported by truck, rail or barge. With a distinct shortage of suitable tank cars, the real question may be... How will we move ethanol?
