CONGRESS v. RAILROADS: Who runs who?

The term "positive train control system" means a system designed to prevent train-to-train collisions, over-speed derailments, incursions into established work zone limits, and the movement of a train through a switch left in the wrong position.

In 2008 Congress mandated that the railroads implement Positive Train Control (PTC) on 40% of their equipment by December 31, 2015. Since then, railroad lobbyists have attempted to delay implementation. Failure to meet the PTC mandate could cost the railroads as much as \$25,000.00 per day for each unmodified locomotive below the required 40% threshold. Congress was forced to grant a three year extension because the railroads failed to make the progress expected.

Perhaps it was partly because the railroads threatened to decline transport of poison by inhalation shipments. Maybe it was because they threatened to suspend passenger service as well. Is it possible the railroads failed to meet implementation because they knew they could hold Congress and the American people hostage with these trump cards?

Railroads have long been viewed to be a vital component of the country's economy and have taken full advantage of this situation to become industrial giants. With that has come the ability to lobby Congress to the tune of many millions of dollars. \$317 million that is; just since the original 2008 mandate, according to the Center for Responsive Politics (CRP).

The railroads have maintained that the \$14.7 billion estimated cost of PTC is prohibitive. But, isn't it worth it for the the lives and livelihoods of the 288 killed and 6,574 injured, that the NTSB says could have been prevented by PTC since 1969?

It seems the railroads have become the 800 pound gorilla in the room with little to keep them in check. Is a double standard in play? When railroads are mandated to modify their equipment and are given years to implement it, they find a way to delay completion and downplay the value of the program. Who knows if the three year extension will hold. It would be interesting to see if these tactics would work on mandated modifications the AAR hands down to the rest of the industry.
